

MORAL CLARITY AI

Independent Architectural Examination Terms

Prospective, evidence-bound examination of specific claims concerning AI governance, runtime control, temporal standing, consequential execution, and related architectural properties.

Payment buys the examination. It does not buy a PASS.

Moral Clarity AI conducts bounded examinations of frozen architectural claims. An examination does not certify an organization, product, platform, or architecture generally. It determines whether a specific frozen implementation demonstrates a specific frozen property under a prospectively constituted examination.

1. What is purchased

The client purchases an independent architectural examination, not a favorable outcome.

Before execution, the parties freeze the implementation and version; exact proposition; governing basis; actor, authority, proposed action and consequence; relevant execution boundary; positive/control condition where applicable; authoritative change (Delta N); expected discrimination; falsifier; admissible evidence; evidence and execution surfaces; and claims expressly outside the examination.

Once frozen, those terms are not changed to accommodate the result.

2. Examination method

Where temporal standing or consequence-relative governance is under examination, the examination ordinarily follows $T0 \rightarrow \Delta N \rightarrow Tn$.

The examination may hold constant the actor, valid authority, permitted action, proposed consequence and execution path while authoritative reality changes.

Delta N1 - standing-preserving change: reality changes, but standing for the exact consequence survives.

Delta N2 - standing-defeating change: reality changes in a way that defeats standing for the exact consequence.

The architecture must discriminate according to the frozen proposition without being supplied the expected determination upstream. A fixture, adapter, model, human, policy flag, status field, natural-language description or other upstream component may not silently encode the property the architecture is claimed to derive.

3. Evidence

Inputs, outputs, relevant intermediate determinations, timestamps, versions, provenance, receipts, hashes, dispositions and available execution evidence are preserved where technically available.

Failures and unexpected results are evidence. An examination is not rewritten after execution to produce a preferred result.

Where the evidence cannot establish the frozen proposition, the record will say so. Where a binary examination has been prospectively constituted as PASS/FAIL, its disposition remains governed by the frozen falsifier.

4. No repair during examination

Moral Clarity AI may identify where a frozen proposition was not established or where its falsifier was triggered.

The examined implementation is not repaired during the examination and then rerun as though the original specimen had passed.

A material architectural change creates a successor implementation. The predecessor retains its original finding. A successor receives no inherited standing from its predecessor and must be examined prospectively on its own evidence.

5. Remediation boundary

Unless separately contracted, architectural remediation, implementation work and redesign are outside the examination.

Identification of a defect does not include an obligation to design its correction. Where examination findings are subsequently used to modify the architecture, examination of that successor is new professional work.

This separation protects both the integrity of the evidence and the independence of subsequent examination.

6. Commercial structure

Moral Clarity AI may perform an initial examination without charge when a claim is sufficiently novel or technically interesting to warrant independent investigation. That is discretionary and creates no entitlement to additional examination.

Examination	Commercial rate
Pass 1 - discretionary independent examination	\$0 when accepted by MCAI
Standard professional examination	\$7,500
Pass 2 - successor examination	\$15,000 (2x standard rate)
Pass 3 - successor examination	\$22,500 (3x standard rate)
Pass 4 - successor examination	\$30,000 (4x standard rate)

Examination	Commercial rate
Pass 5 - successor examination	\$37,500 (5x standard rate)

The successor progression reflects repeated professional examination of materially changed implementations. No examination begins until its frozen scope and commercial terms are accepted.

Enterprise and production examinations: production access, multiple execution paths, regulated evidence, confidentiality requirements, downstream execution witnesses, institutional reporting, or materially broader scope are separately quoted and are not governed by the standard rate table above.

7. Independence

The examiner evaluates the frozen architecture against the frozen proposition and evidence and does not guarantee a favorable result.

Where Moral Clarity AI has materially designed or implemented the property being examined, that relationship must be disclosed and the scope structured so the resulting evidence does not falsely imply independence that did not exist.

Where stronger third-party independence is required for certification, regulatory, contractual or institutional purposes, an appropriately independent examiner may be required.

8. What a PASS means

A PASS means only that the frozen implementation demonstrated the frozen proposition under the frozen examination conditions without triggering the prospectively defined falsifier.

It does not establish universal correctness, architectural equivalence, regulatory certification, future-version standing, security against every threat, detection of every possible change in reality, correctness outside the examined consequence, or properties not included in the frozen proposition.

A PASS belongs to the examined implementation and examination record. It does not automatically transfer to a successor.

9. What an adverse or unestablished result means

A failure means the frozen implementation did not satisfy the prospectively constituted examination. A NOT ESTABLISHED finding means the preserved evidence did not establish the frozen proposition under the examination as run.

Neither finding means the entire architecture is worthless, unsafe, or incapable of improvement. The finding remains attached to the examined specimen.

A subsequent successor may be examined separately and may produce a different result without rewriting the predecessor's record.

10. Publication, confidentiality and attribution

Public disclosure, confidentiality, naming rights, evidence publication and attribution are agreed before a professional examination begins.

Moral Clarity AI will not characterize a private examination as public certification unless the engagement expressly provides for that representation.

Published findings remain bounded to what the preserved evidence establishes.

11. Governing principle

The examination exists to answer the frozen question - not to produce a desired answer.

Claims are frozen before testing. Failures are preserved. Successors are examined prospectively. Evidence determines the finding.

**Models propose.
Governance decides.
Evidence survives.**

Effective: September 28, 2026
